Version: 1.1

Give context-free grammars for each of the following languages.

Solution: $S \to \varepsilon \mid 00S1$.

 $2 \quad \{0^m 1^n \mid m \neq 2n\}$

(Hint: If $m \neq 2n$, then either m < 2n or m > 2n.)

Solution:

To simplify notation, let $\Delta(w) = \#(0, w) - 2\#(1, w)$. Our solution follows the following logic. Let w be an arbitrary string in this language.

- Because $\Delta(w) \neq 0$, then either $\Delta(w) > 0$ or $\Delta(w) < 0$.
- If $\Delta(w) > 0$, then $w = 0^i z$ for some integer i > 0 and some suffix z with $\Delta(z) = 0$.
- If $\Delta(w) < 0$, then $w = x1^j$ for some integer j > 0 and some prefix x with either $\Delta(x) = 0$ or $\Delta(x) = 1$.
- Substrings with $\Delta = 0$ is generated by the previous grammar; we need only a small tweak to generate substrings with $\Delta = 1$.

Here is one way to encode this case analysis as a CFG. The nonterminals M and L generate all strings where the many L is than L generate all strings where the many L is than L generate all strings with L is than L is than L generate all strings where L is than L is that L is the L is that L is that

Here is a different correct solution using the same logic. We either identify a non-empty prefix of 0s or a non-empty prefix of 1s, so that the rest of the string is as "balanced" as possible. We also generate strings with $\Delta = 1$ using a separate non-terminal.

$$S \to AE \mid EB \mid FB$$
 $\{0^{m}1^{n} \mid m \neq 2n\}$

$$A \to 0 \mid 0A$$
 $0^{+} = \{0^{i} \mid i \geq 1\}$

$$B \to 1 \mid 1B$$
 $1^{+} = \{1^{j} \mid j \geq 1\}$

$$E \to \varepsilon \mid 00E1$$
 $\{0^{m}1^{n} \mid m = 2n\}$

$$F \to 0E$$
 $\{0^{m}1^{n} \mid m = 2n + 1\}$

Alternatively, we can separately generate all strings of the form $0^{\text{odd}}1^*$, so that we don't have to worry about the case $\Delta = 1$ separately.

$$\begin{split} S \to D \mid M \mid L & \{0^m 1^n \mid m \neq 2n\} \\ D \to 0 \mid 00D \mid D1 & \{0^m 1^n \mid m \text{ is odd}\} \\ M \to 0M \mid 0E & \{0^m 1^n \mid m > 2n\} \\ L \to L1 \mid E1 & \{0^m 1^n \mid m < 2n \text{ and } m \text{ is even}\} \\ E \to \varepsilon \mid 00E1 & \{0^m 1^n \mid m = 2n\} \end{split}$$

Solution:

Intuitively, we can parse any string $w \in L$ as follows. First, remove the first 2k 0s and the last k 1s, for the largest possible value of k. The remaining string cannot be empty, and it must consist entirely of 0s, entirely of 1s, or a single 0 followed by 1s.

$$S \to 00S1 \mid A \mid B \mid C$$
 $\{0^{m}1^{n} \mid m \neq 2n\}$
 $A \to 0 \mid 0A$ 0^{+}
 $B \to 1 \mid 1B$ 1^{+}
 $C \to 0 \mid 0B$ 01^{+}

Lets elaborate on the above, since k is maximal, $w = 0^{2k}w'1^k$. If w' starts with 00, and ends with a 1, then we can increase k by one. As such, w' is either in 0^+ or 1^+ . If w' contains both 0s and 1s, then it can contain only a single 0, followed potentially by 1^+ . We conclude that $w' \in 0^+ + 1^+ + 01^+$.

 $3 \quad \{0,1\}^* \setminus \{0^{2n}1^n \mid n \ge 0\}$

Solution:

This language is the union of the previous language and the complement of 0^*1^* , which is $(0+1)^*10(0+1)^*$.

$$\begin{array}{lll} T \to 00T1 & | A & | B & | C & \{0^m1^n & | m \neq 2n\} \\ & \text{https://tutorcs.com} & 0^+ \\ & & & 1^+ \\ & C \to 0 & | & 0B & 01^+ \\ & X \text{Weehat: cstutorcs} & (0+1)^*10(0+1)^* \\ & Z \to \varepsilon & | & 0Z & | & 1Z & (0+1)^* \end{array}$$

Work on these later:

 $\{w \in \{0,1\}^* \mid \#(0,w) = 2 \cdot \#(1,w)\}$ – Binary strings where the number of 0s is exactly twice the number of 1s.

Solution:

 $S \rightarrow \varepsilon \mid SS \mid 00S1 \mid 0S1S0 \mid 1S00.$

Here is a sketch of a correctness proof.

For any string w, let $\Delta(w) = \#(0, w) - 2 \cdot \#(1, w)$. Suppose w is a binary string such that $\Delta(w) = 0$. Suppose w is nonempty and has no non-empty proper prefix x such that $\Delta(x) = 0$. There are three possibilities to consider:

• Suppose $\Delta(x) > 0$ for every proper prefix x of w. In this case, w must start with 00 and end with 1. Thus, w = 00x1 for some string $x \in L$.

- Suppose $\Delta(x) < 0$ for every proper prefix x of w. In this case, w must start with 1 and end with 00. Let x be the shortest non-empty prefix with $\Delta(x) = 1$. Thus, w = 1X00 for some string $x \in L$.
- Finally, suppose $\Delta(x) > 0$ for some prefix x and $\Delta(x') < 0$ for some longer proper prefix x'. Let x' be the shortest non-empty proper prefix of w with $\Delta < 0$. Then x' = 0y1 for some substring y with $\Delta(y) = 0$, and thus w = 0y1z0 for some strings $y, z \in L$.

Solution:

All strings of odd length are in L.

Let w be any even-length string in L, and let m = |w|/2. For some index $i \le m$, we have $w_i \ne w_{m+i}$. Thus, w can be written as either x1y0z or x0y1z for some substrings x, y, z such that |x| = i - 1, |y| = m - 1, and |z| = m - i. We can further decompose y into a prefix of length i - 1 and a suffix of length m - i. So we can write any even-length string $w \in L$ as either x1x'z'0z or x0x'z'1z, for some strings x, x', z, z' with |x| = |x'| = i - 1 and |z| = |z'| = m - i. Said more simply, we can divide w into two odd-length strings, one with a 0 at its center, and the other with a 1 at its center.

$$S \rightarrow AB \mid BA \mid A \mid B$$
 strings not of the form ww
